A Coordinated West Florida Coastal Ocean Observing and Modeling System: Oceanographic Applications Where Society Meets the Sea

Robert H. Weisberg, Yonggang Liu, Clifford R. Merz, Lianyuan Zheng, Jeff Donovan, Jay Law, and Dennis Mayer
College of Marine Science, University of South Florida, 140 7th Avenue South, St. Petersburg, FL

Long-term moorings collect ocean velocity, temperature and salinity data across the water column, along with surface meteorological data.

Complimentary observations include gliders, measuring water properties along planned transects, and an example being our response to the 2014 red-tide event.

The USF Coastal Ocean Monitoring and Prediction System (COMPS) has been supported by a variety of sources, beginning with the USGS at its inception, continuing with MMS, ONR and NOAA support, along with that from the State of Florida through USF. Current support to the in situ moorings and the HF radar observations are by NOAA IOOS through SECOORA. Data analysis is also supported by NASA.
