

A Coupled Marine Environmental Assessment and Prediction System for the Southeastern U.S. Coastal Ocean in Support of Effective Marine Ecosystem-Based Management, Efficient Marine Operations, and Resilient Coastal Communities

Ruoying He

Ocean Observing and Modeling Group (OOMG)

North Carolina State University

Objective and Approach

Objective

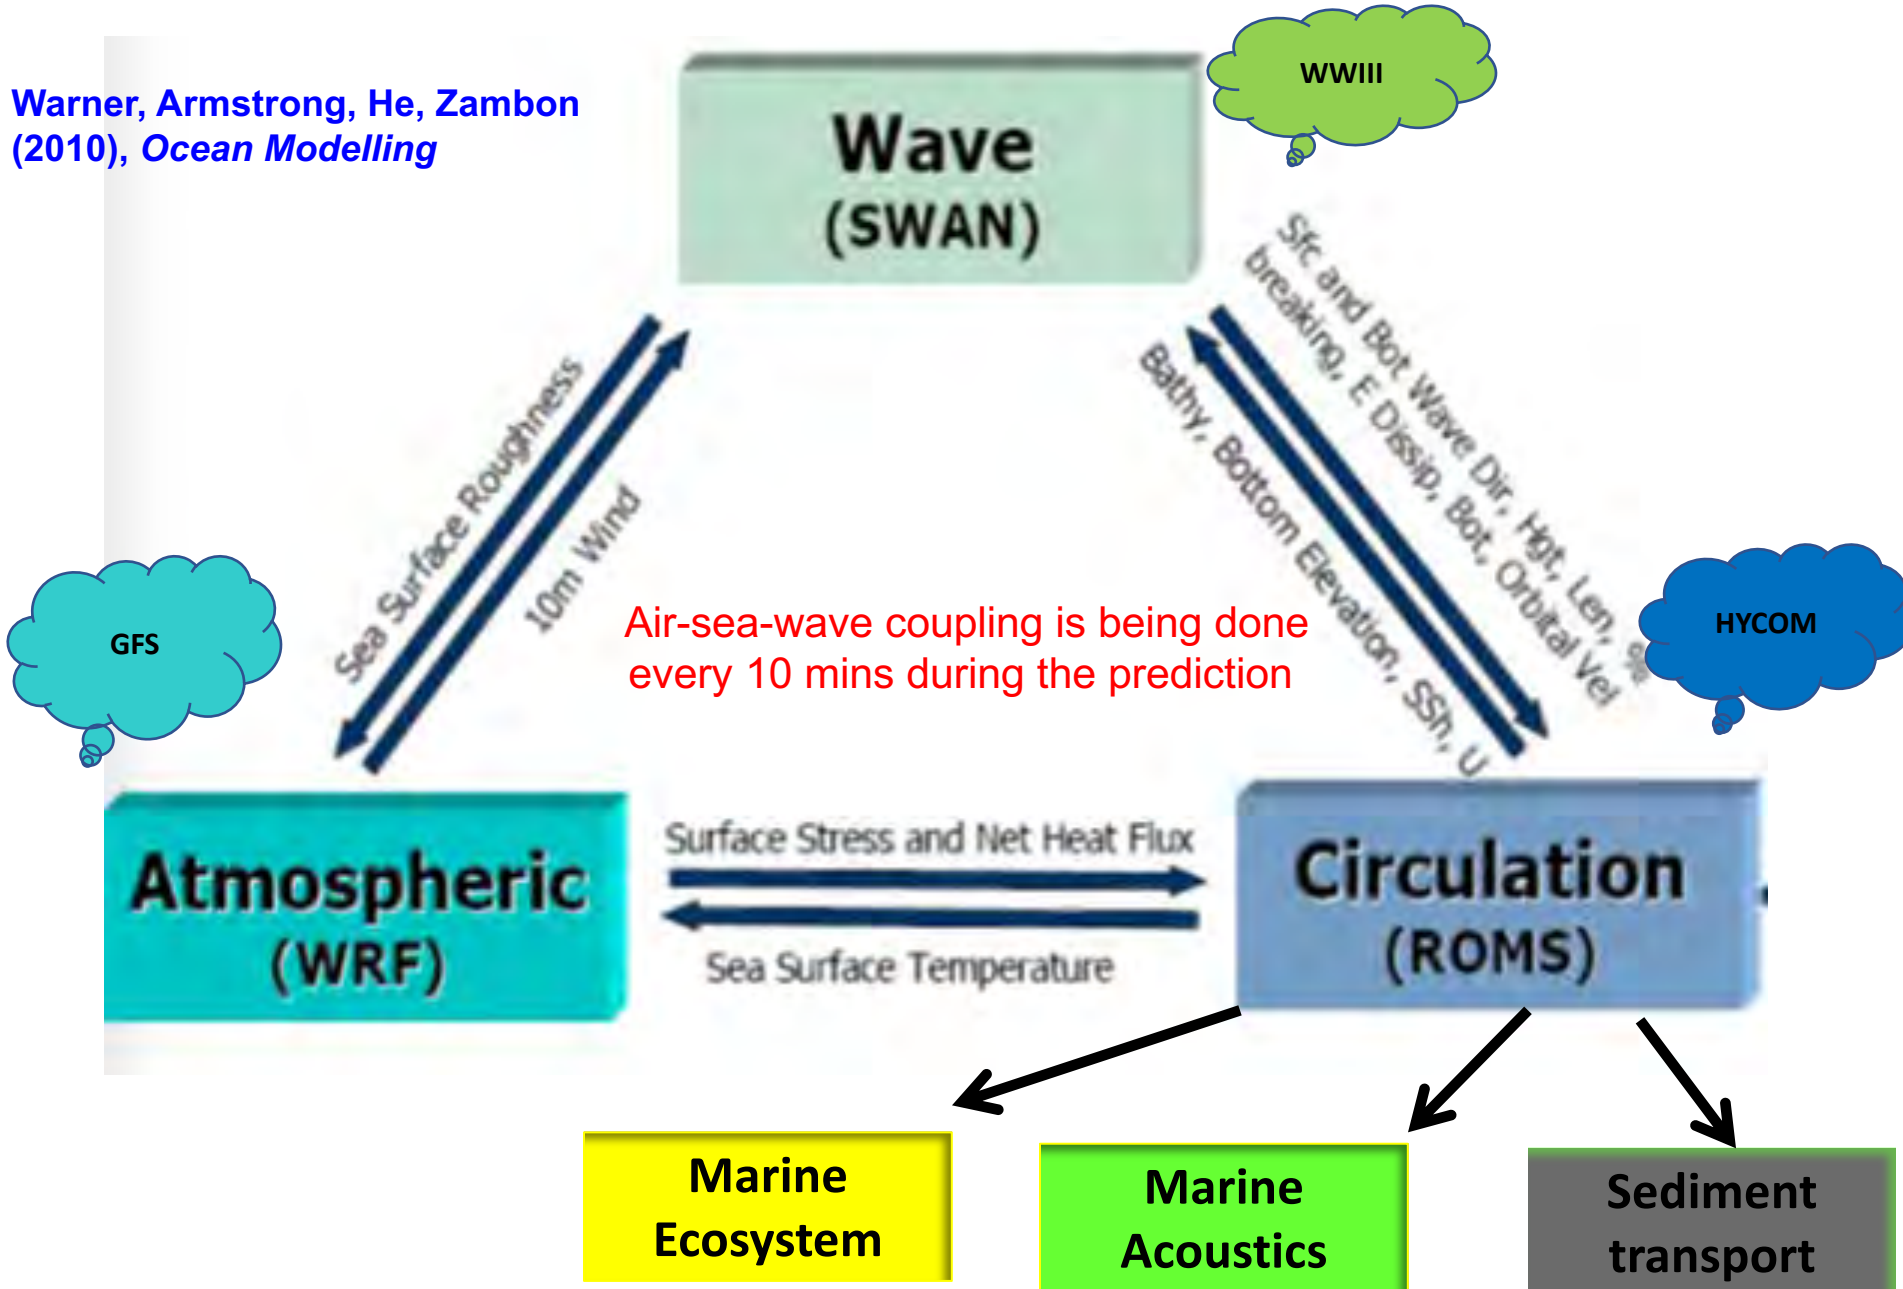

- Developing an advanced regional marine environment assessment and prediction capability
- Contributing to the effort of building a regional ocean observatory
- Providing marine environment hindcast, nowcast, forecast to support research and operations in climate change, coastal hazards, safe and efficient marine operations, water quality and living marine resource management

Approach

- Implement, operate, and refine a fully coupled ocean-atmosphere-wave-marine ecosystem prediction modeling system
- Operate the system to predict coastal ocean conditions over the entire SECOORA footprint with a high degree of scientific accuracy, and update and transmit such information to stakeholders in a timely fashion.
- Inform and update the system continuously through data assimilation.

Fully Coupled Marine Environment Modeling System

Impact

- Stakeholder groups include:
 - U.S. Coast Guard
 - NOAA National Marine Fisheries Service
 - NOAA Office of Response and Restoration
 - Bureau of Ocean Energy Management
 - NC Department of Environmental Quality
 - Florida Fish and Wildlife Conservation Commission
 - the South Atlantic Fishery Management Council
 - individual fisherman
 - Students (graduate, undergraduate, k-12)
- Benefits include the ability to inform public and coastal managers of
 - the paths and intensities of storms and the resulting wave and water level buildup along the coast,
 - when and where polluted water could move across the shelf into our coastal areas,
 - define habitat interconnectivity for commercially important fish or crustacean species, and
 - determine physical processes affecting the lifecycles of those species.
